

What Are Animals?

Animals are living things. They can move, grow, and need food to survive.

Animals are grouped based on their body structure. One important way to group animals is by checking if they have a backbone or not.

Vertebrates

Vertebrates are animals that have a backbone or spine.

The backbone helps support the body and protects the spinal cord.

Types of Vertebrates

There are five main groups of vertebrates:

1. Mammals

- Have hair or fur
- Give birth to babies
- Babies drink milk
- Examples: dog, cat, cow, human

2. Birds

- Have feathers and wings
- Lay eggs
- Most birds can fly
- Examples: parrot, eagle, sparrow

Vertebrates

3. Fish

- Live in water
- Have fins and gills
- Lay eggs
- Examples: goldfish, shark

4. Reptiles

- Have dry, scaly skin
- Lay eggs
- Examples: snake, lizard, crocodile

5. Amphibians

- Can live on land and in water
- Have smooth skin
- Examples: frog, toad

Invertebrates

Invertebrates are animals that do NOT have a backbone.

Most animals in the world are invertebrates.

Types of Invertebrates

1. Insects – six legs (ant, butterfly)
2. Arachnids – eight legs (spider)
3. Mollusks – soft bodies (snail, octopus)
4. Worms – long, soft bodies (earthworm)
5. Crustaceans – hard shells (crab, shrimp)
