

About Plants

Plants are living things,
just like us! They are
important because
they give us oxygen to
breathe, food to eat,
and make the world a
beautiful and green
place!

Plants can be in the form of...

trees

shrubs

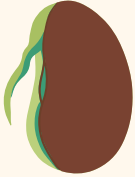

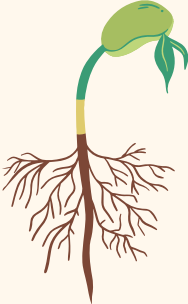

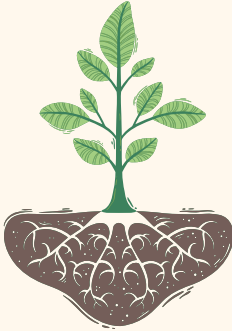

vegetables

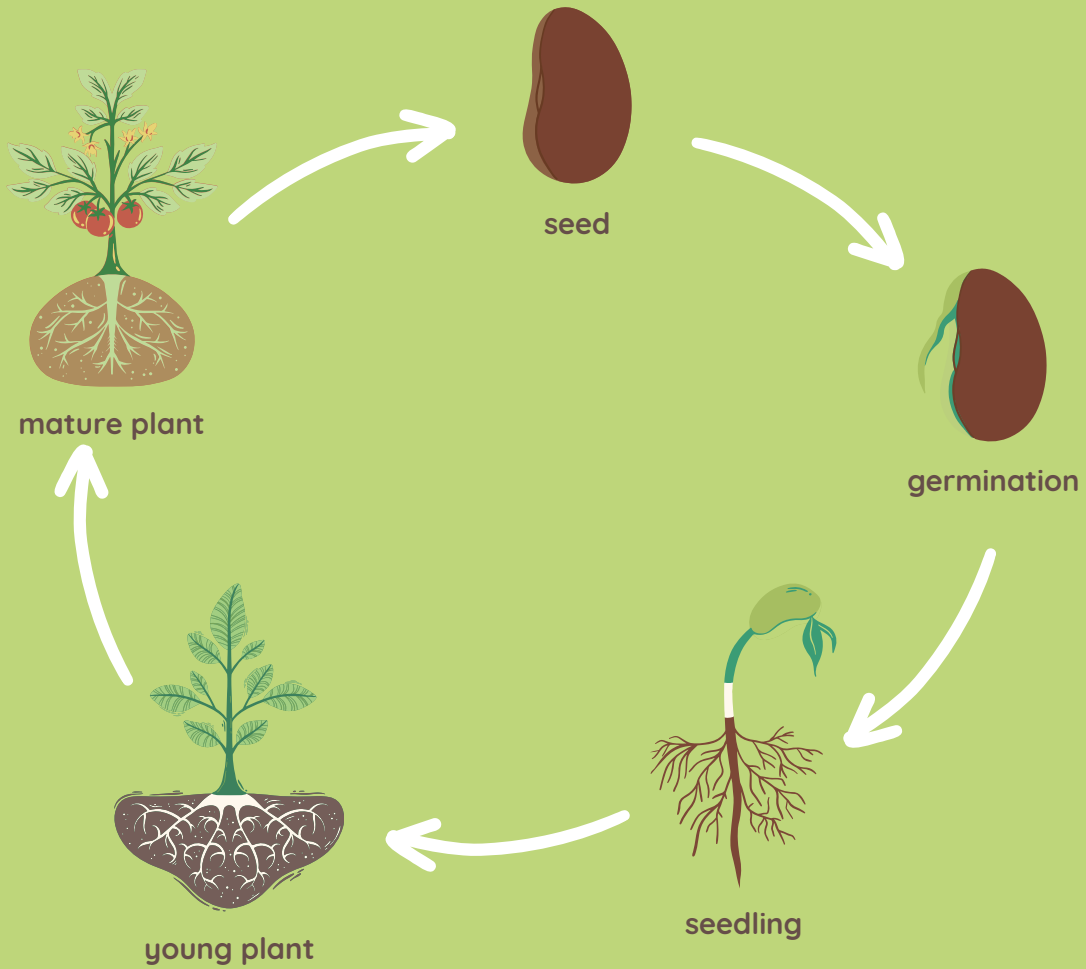

herbs

Stages of a plant's growth.

 seed	 germination	 seedling	 young plant	 mature plant

Life cycle of a plant

Plant is made up of these two major systems:

shoot system

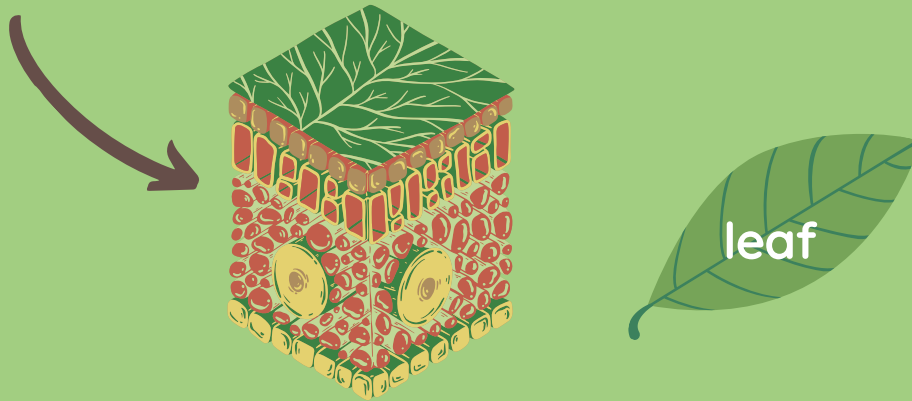

refer to all parts that grow above the ground. vegetative portions (stems and leaves) and reproductive parts (flowers and fruits)

root system

all parts that grow under the soil

This is a cross-section of a leaf

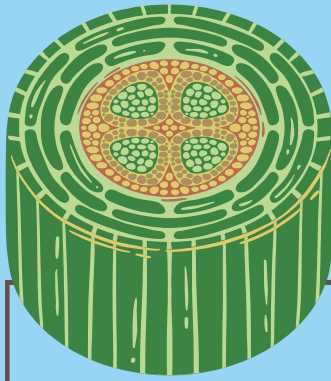

Leaves are like little food factories for plants. They use sunlight to make food through a process called photosynthesis. They take in air through tiny holes called stomata, and with the help of sunlight and water, they make food for the plant. This food keeps the plant healthy and helps it grow. So, leaves are super important for plants to live and thrive!

Photosynthesis

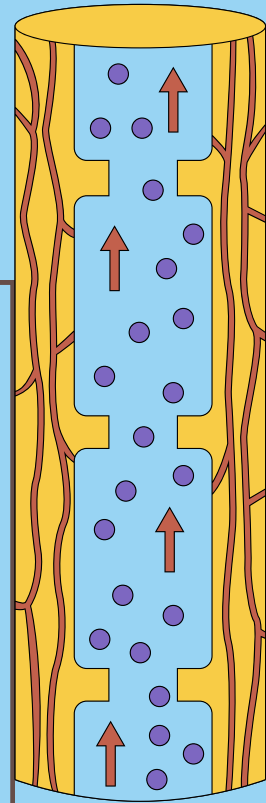

Photosynthesis is a process by which plants make their own food using sunlight and Chlorophyll.

This is the cross-section of a root

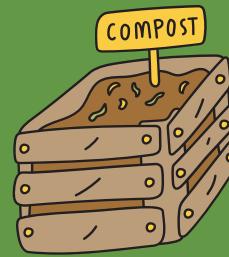

Roots are like anchors for plants. They're the part of the plant that goes into the soil and holds it in place. But roots do more than that – they also drink water from the soil to keep the plant hydrated and healthy. So, roots help plants stay grounded and get the water they need to grow big and strong.

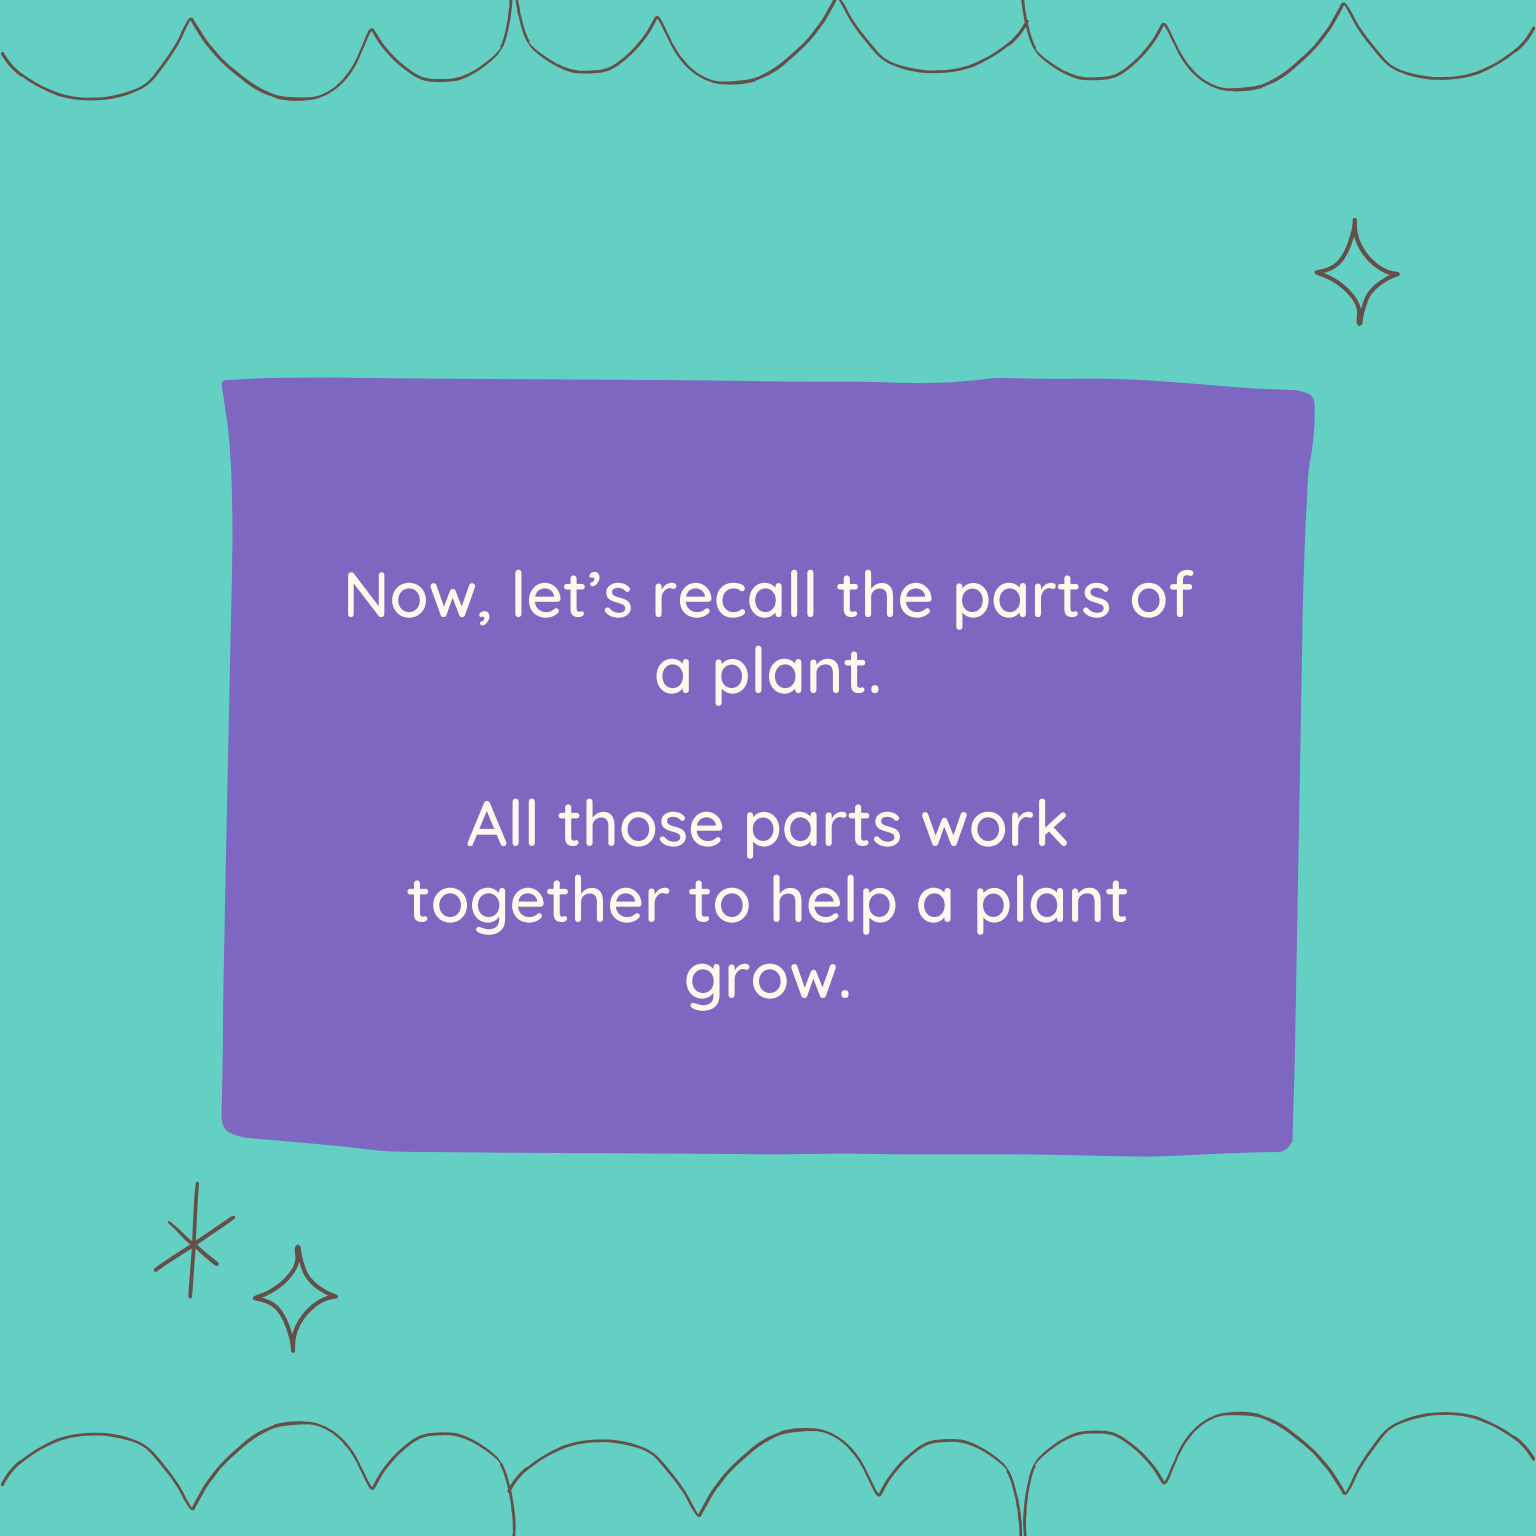

* Needs of the plants *

Plants, like people, have certain needs to live and grow. Here are the key needs of a plant:

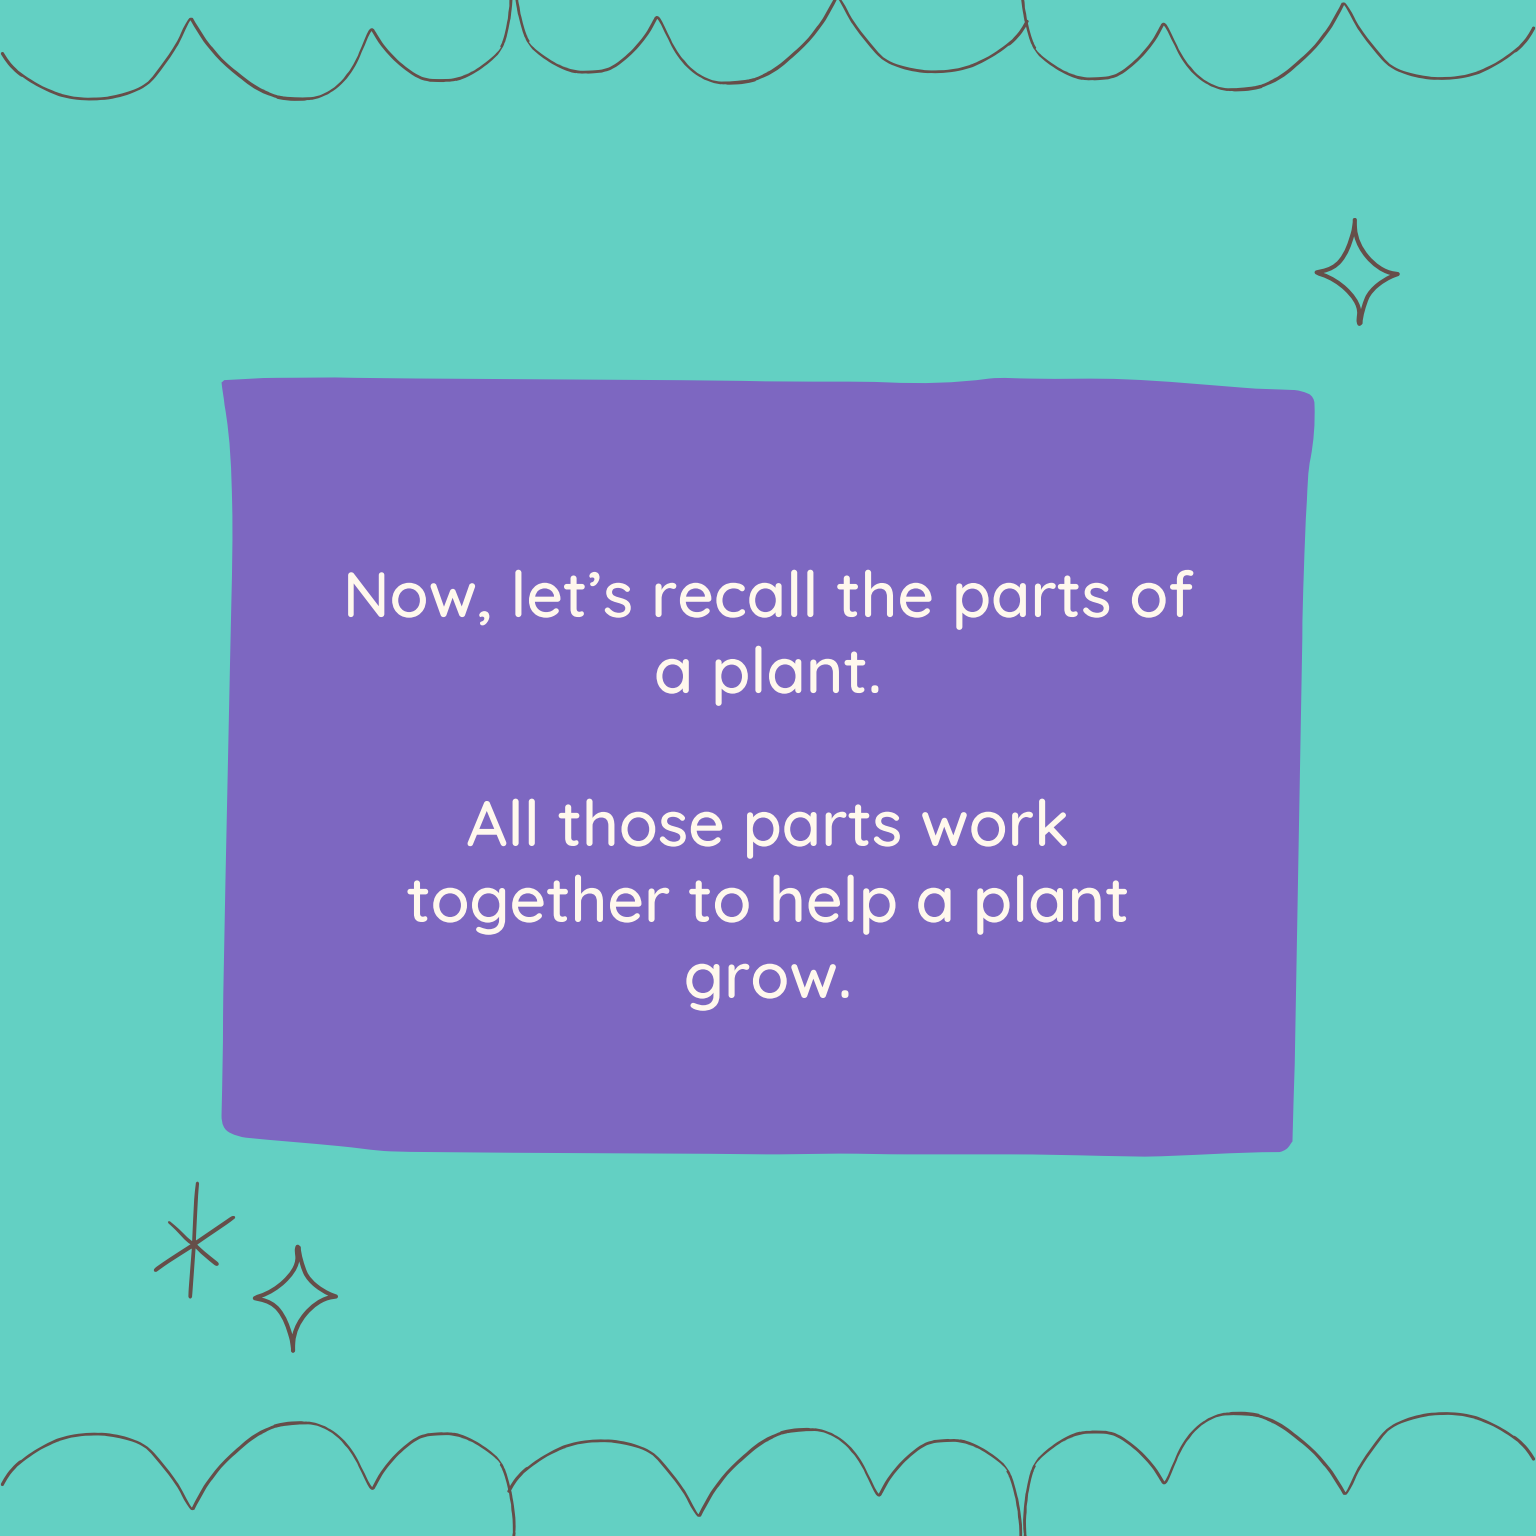

Sunlight, Water, Air, Nutrients, Soil and Space

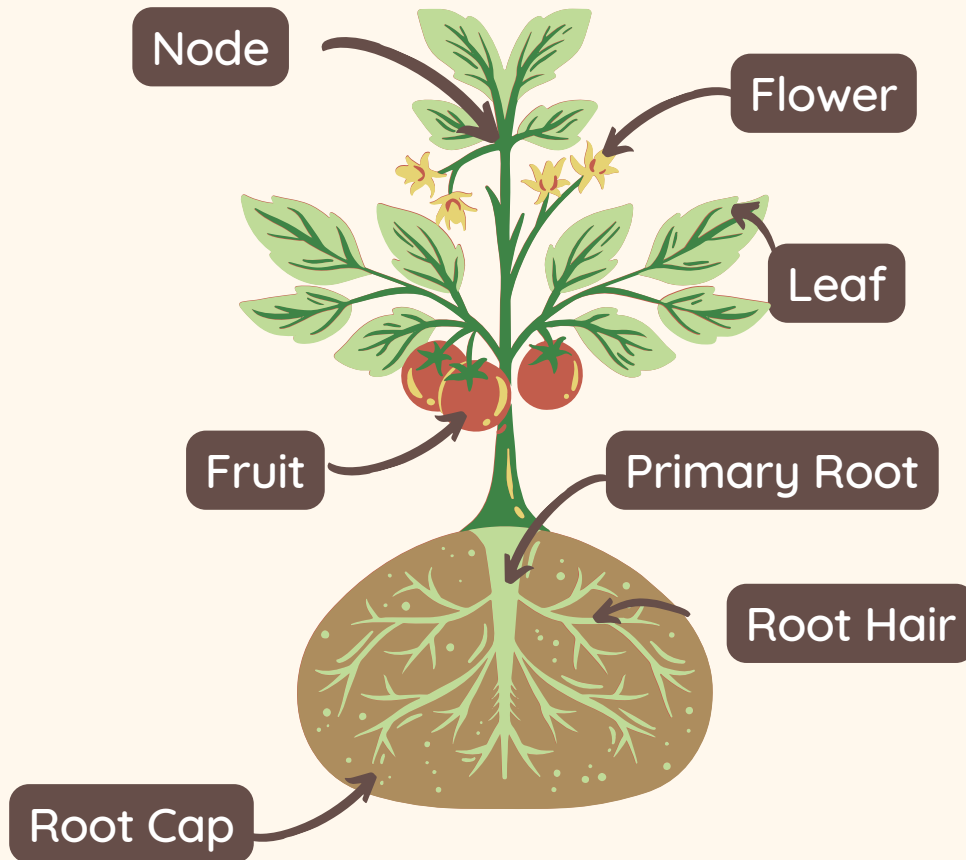

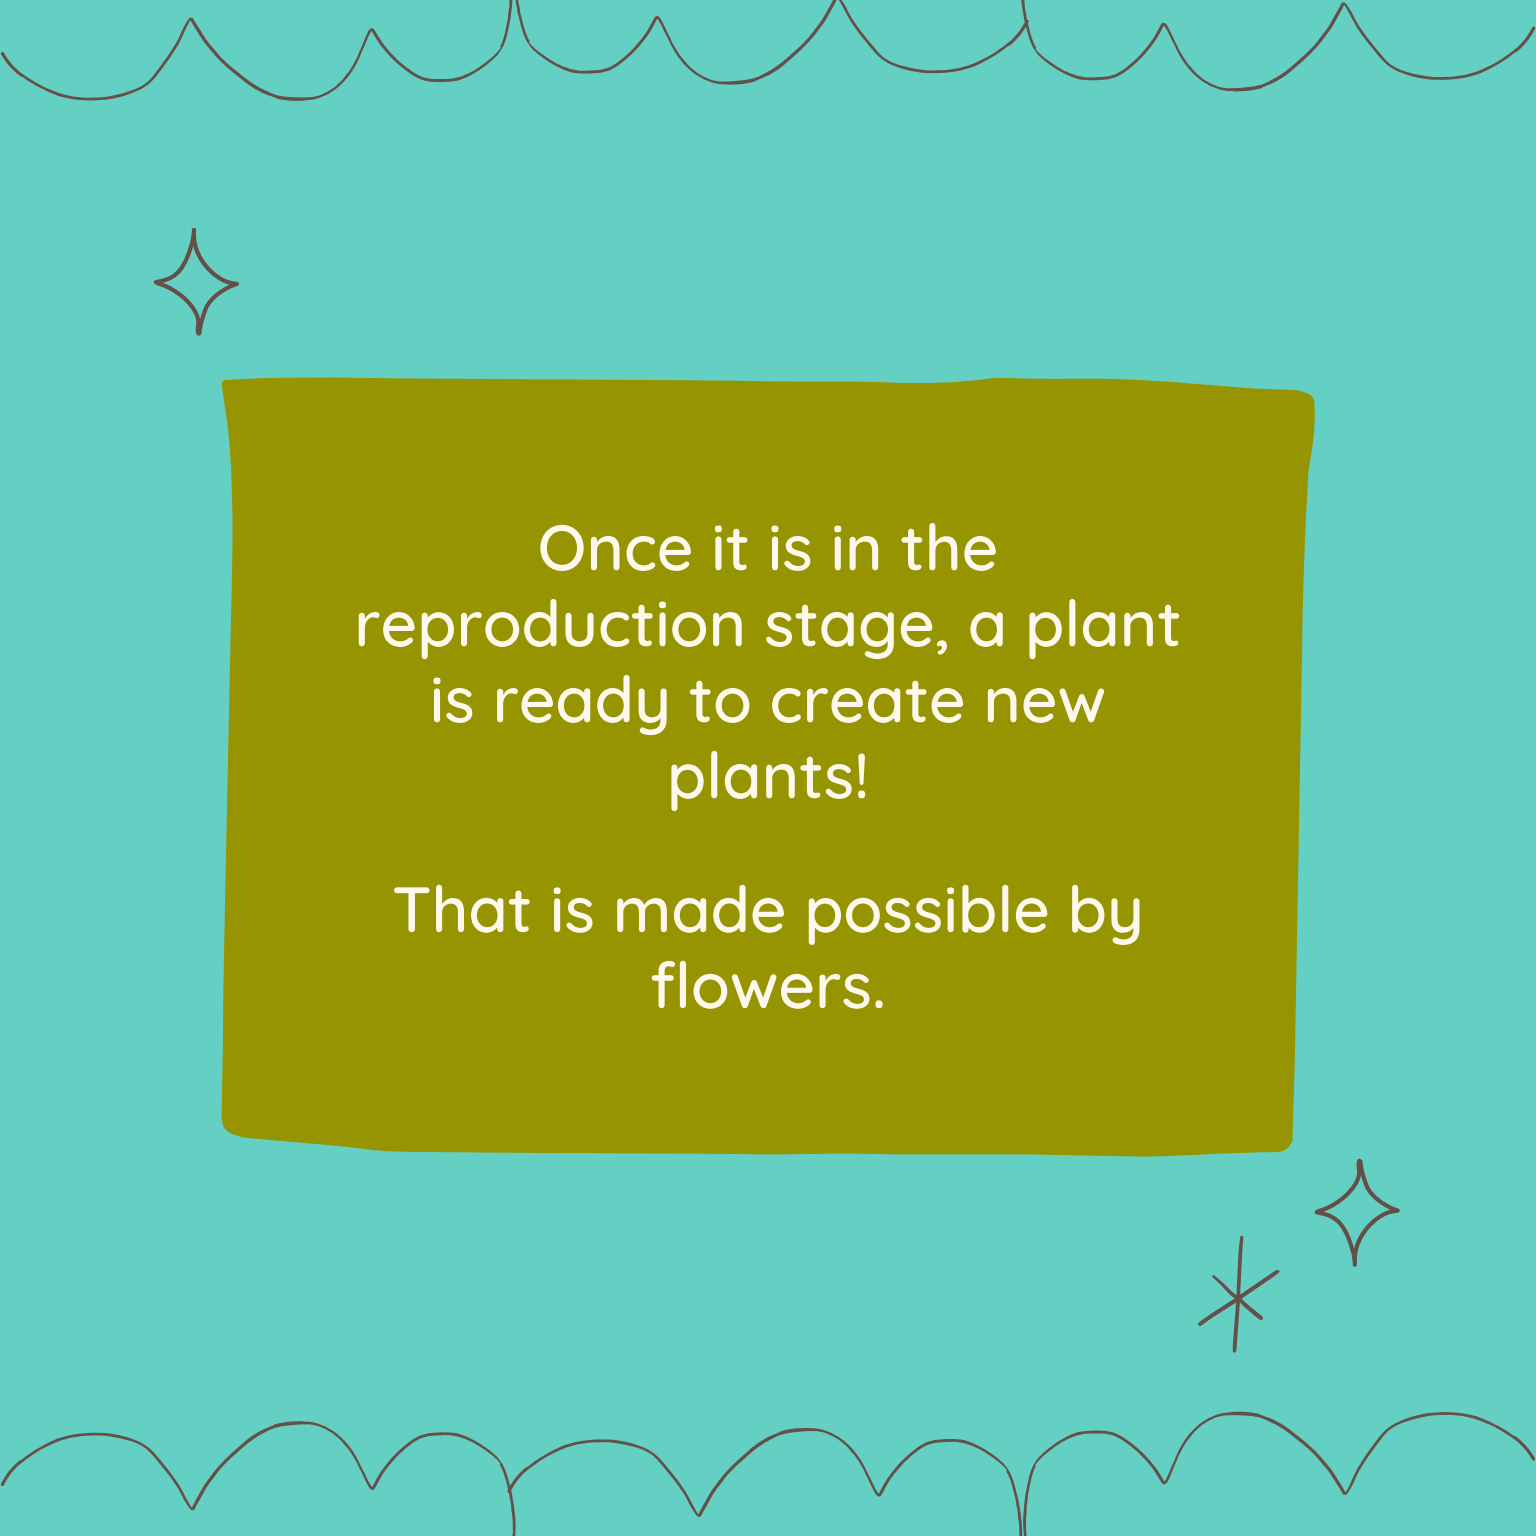

Now, let's recall the parts of
a plant.

All those parts work
together to help a plant
grow.

These are the main parts of a plant.

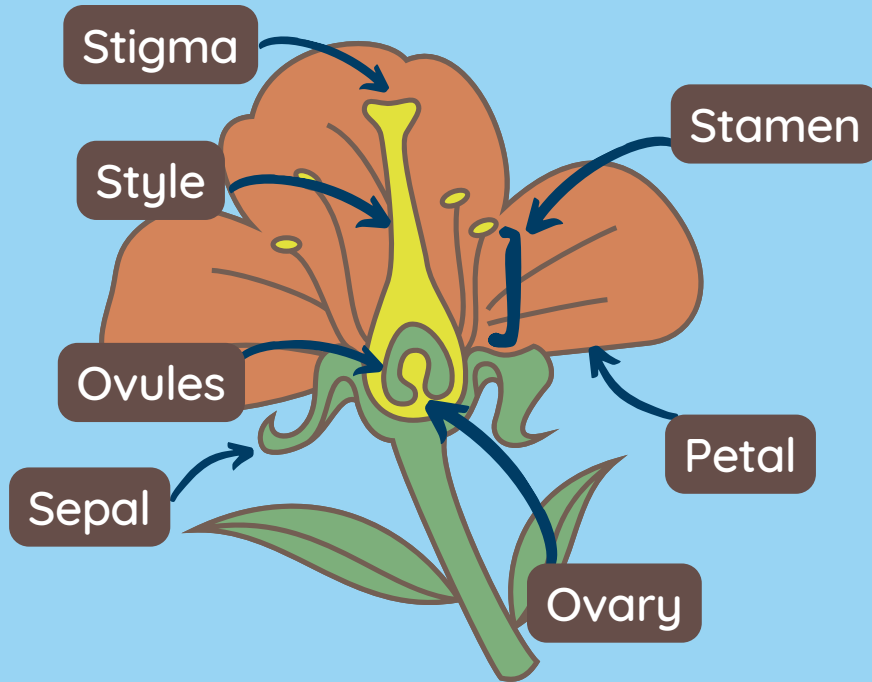

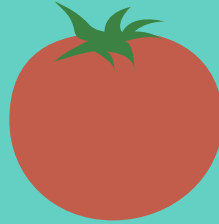

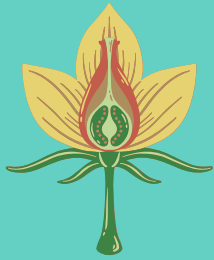

Once it is in the
reproduction stage, a plant
is ready to create new
plants!

That is made possible by
flowers.

Parts of a flower

Pistil = Stigma+Style+Ovules+ Ovary

Flowers become fruits and
those fruits will have seeds.

And from those seeds,
new plants will grow!

Plant growth refers to the different stages of a plant's development.

Arrange these stages of plant growth in their correct order.

seedling

germination

mature plant

seed

young plant
